

The English scholar Robert  
GROSSETESTE (c. 1175-1253)  
recalculated Ptolemy's lunar-solar  
ship and amended it to a gain  
of a day every 304 years - closer  
to the actual drift against the  
Julian year of a day every 308.5  
years. He proposed that one day  
be dropped from the lunar

Cal every 3 centuries. Rosselste,  
Chancellor of Oxford Univ. and later a bishop,  
also closely studied measurements of the  
solar year, confirming the values arrived  
at by Hipparchus, Ptolemy, al-Battani  
and other Arabs and Greeks. This led him to  
suggest a new starting point for Easter Calculation  
(a spring equinox of Mar. 14 instead of Mar 21)  
to compensate for the centuries long drift  
in the Cal. against the Cal. Yr.

1210-1212

MARIA was Crusader King  
of ~~Jerusalem~~. Latin Jerusalem
